Credit Name: 2nd programing language

Assignment Name:

Printing

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

None of this project really confused me, i just mixed the skill builer 'Hurricane' from chapter 4 and my mastery 'Change' from chapter 3 to figure out the calculations and methods.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I decided to start with the part I was most familar with and started with using a method to convert the amount of copies the user entered to the price for each copy depending on the amount of copies. then I started the calculations for the total price.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I wrote my code in peices, focusing at one part at a time and testing it before I started coding the calculation part to check if the program would display the price per copy before I calculated the total.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

During my code I had trouble with the beginning of the method. I asked google learned that instead of "string. getCategory" I had to use "double.getCategory"

Learning

Was there anything you learned that you think will help you with future challenges?

I learned that "string" was used for words and symboles and like sentences, while "double is used for numbers and decimals and more calculations"
