Credit Name: 2nd programing language

Assignment Name:

PizzaCost

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

at first when reading the requirments for the mastery project I didnt understand how to read the calculation '$0.05*diameter*diameter' I googled the equation and understood it was asking for '0.! r '0.05d squared'.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I used the same coding structure that I used for all my skill builders. my plan was to start with the constants, '0.75' and '1.00' then ask for the diameter before calculating and printing out the total cost of making the pizza.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I tried most of it at once but I ended up figuring the calculation part last cause that took me longer. I ended up testing to make sure the program asked the user for the right information then testing if it calculated right

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

I think i just had trouble with what it was asking me to calculate. and googled what the instructions were asking me to do.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned *diameter*daiamter meant diameter squared.
