Credit Name: 2nd Language Programming

Assignment Name: Change

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I used the knowlege I got from computer science 10 to know roughly what I was doing. and used simlar skillbuilders like 'Digits' to guide me when I was stuck

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I used the same structure from all the skill builders, starting with declaring variables, get user inputs, then do calculations right berfore displaying the amount of coins for the change

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I ended up testing it at the end then fixing my errors at the end

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

I put the variables with decimals cause at first i thought of it like "double quarter = 0.25;" but then I realized the user's input was already in cents so i fixed them to "Int quarter = 25;" so i just looked it over to realize my problem

Learning

Was there anything you learned that you think will help you with future challenges?

to pay attention to what measurement or type of money it is. Like if its in cents already then dont but the varibles as if the input were in dollars.
