Credit Name: Procedural Programming 1

Assignment Name:MetricConversion

Error Log Entry

What error message did you encounter (if any)?

I didn't encounter any errors

What unexpected behavior did your program exhibit?

when I was coding the metric conversion options I clicked on the auto method option when i hover over the name of my method, I did not expect Java to make them private methods instead of public ones.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

I had accidentally wrote the metric values opposite to eachother but no actual error message came up.

Include a screenshot of specific lines of code.

I don't have a screen shot of my mistake

How did you fix the issue?

I fixed the issue by swapping the inches and centimeters around into the right place

Provide the corrected code or solution using a screenshot.

```
   //converting centimeters to inches ( centimeters / 2.54)
   public static void convertCentimeterstoInches(Scanner userinput)
 {
     System.out.print("Enter the number of centimeters: ");
     if (userinput.hasNextDouble())
 {
         double centimeters = userinput.nextDouble();
         double inches = centimeters / 2.54;
   //display values
         System.out.println(centimeters + " centimeters is equal to " + inches + " inches.");
 }     else
 {
         System.out.println("Error: Invalid input for centimeters.");
 }
```
