Credit Name: Procedural Programming 1

Assignment Name: MetricConversion

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I at first struggled with the order of the metric units but that was the only issue.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I used my 'time converter' skill builder as guidance to complete my Metric conversion mastery. Since have mostly the same structure but with different purposes and one with 8 choices instead of 3.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I tested the first metric unit conversion before I continued to add the rest.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

When I was unsure of what to do nect i looked back at past chapters and skill builders to see if i encountered a simaler issue before and take the solution from there.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned that testing the first part of the code is very benificail so i know where I went wrong without having to search all of the code.
