2. Method declaration: Defines the method's name, return type, and parameters.

   Method body: Contains the code that performs the method's task.

3. Access modifier.

4. Visibility.

5. var1: Can be used throughout the main method.

   var2: Can only be used inside the second for loop.

   var3: Can be used throughout method1().

   var4: Can only be used inside the first for loop.

6.

   A) public static int getVowels(String word)
   B) public static int extractDigit(int number)
   C) public static String insertString(String word, int number)

7.

   a) With method signatures, which include the method name and parameter types.
   b) Yes, two methods can have the same name as long as they have different parameters. (like different numbers or types of inputs).

8.

   a) A return statement is used to send a value back to the calling method and end the method.
   b) A return statement can send back one value.
   c) A method that returns a value uses a data type such as int, double, or String. A method that does not return a value uses void.

9. I see no error

11.

   a) True, it breaks a larger task into smaller methods.
   b) False, a method call executes a method.
   c) False, void methods do not return a value.
   d) False, it determines who can access the method.
   e) True, Static methods belong to the class.

f) False, the parameters are enclosed by parentheses ().
g) False, local variables are limited to their scope.
h) True, a method can change its local parameter value.
i) False, it means methods share a name but have different parameters.
j) True, it returns a value to the caller.
k) False, it states what must be true before the method runs.
l) False, it describes what is true after the method finishes.
